

Wiring Compose for Images

First real step of the deployment plan: every buildable service in `docker-compose.yml` now also knows what to call itself once it's an image.

file: `docker-compose.yml` 2026-08-16

01 What changed

Five services — `sync`, `coder-commands-mcp`, `docker-mcp`, `postgres-mcp`, `gateway` — each gained one line: an `image:` reference alongside the `build:` they already had. `postgres` needed nothing; it was already image-only.

02 Why both keys on one service

No duplication, no second file yet — the same block answers both "how do I build you" and "what do I call you once built."

03 The actual diff

DOCKER-COMPOSE.YML — FIVE ADDITIONS

```

sync:
  build: ./sync
  image: clubuntu.dala-cirius.ts.net:5000/sync:${IMAGE_TAG:-dev}
  container_name: codercommands-sync

coder-commands-mcp:
  
```

```
build: ./coder-commands-mcp
image: clubuntu.dala-cirius.ts.net:5000/coder-commands-mcp:${IMAGE_TAG:-dev}
container_name: coder-commands-mcp
```

docker-mcp:

```
build: ./docker-mcp
image: clubuntu.dala-cirius.ts.net:5000/docker-mcp:${IMAGE_TAG:-dev}
container_name: codercommands-docker-mcp
```

postgres-mcp:

```
build: ./postgres-mcp
image: clubuntu.dala-cirius.ts.net:5000/postgres-mcp:${IMAGE_TAG:-dev}
container_name: codercommands-postgres-mcp
```

gateway:

```
build: ./api
image: clubuntu.dala-cirius.ts.net:5000/gateway:${IMAGE_TAG:-dev}
container_name: generic-mcp-gateway
```

`${IMAGE_TAG:-dev}` — CI sets `IMAGE_TAG` to a commit SHA; a plain local build with nothing set falls back to `:dev`, so this file still works exactly as before for local dev.

04 Verified

```
$ docker compose config --quiet
CONFIG_OK
```

File parses clean, all five image references resolve, nothing else in the stack's behavior changed — this step only adds a name each service can be pushed and pulled by.

05 Next

- ▶ `docker-compose.deploy.yml` — the image-only file that actually runs on clubuntu
- ▶ `.github/workflows/build.yml` and `deploy.yml`
- ▶ Commit and push everything to `kat-e8/manpage`
