

The Deploy-Only Compose File

A new file, `docker-compose.deploy.yml` — the one that actually runs on clubuntu. No Dockerfiles, no build context, no source tree required to bring it up.

file: `docker-compose.deploy.yml` (new) 2026-08-16

01 What changed

All six services, mirrored from `docker-compose.yml` 's runtime config exactly — `environment`, `volumes`, `depends_on`, `networks`, `healthcheck` — with every `build:` key removed and every `image:` pinned to `${IMAGE_TAG}`, no dev fallback.

02 Two files, two machines, one truth

`docker-compose.yml`

```
build: + image:
dev laptop - source tree present
```

`${IMAGE_TAG:-dev}` fallback `docker-compose.deploy.yml` `image:` only clubuntu — no source, ever `${IMAGE_TAG}` required, set by CI both describe the same six services — one can build them, the other can only run what's already built

Kept as two files rather than one conditional file on purpose — clubuntu should never even have the option of trying to build something.

03 Excerpt

DOCKER-COMPOSE.DEPLOY.YML — TWO OF SIX SERVICES SHOWN

```
name: codercommands

services:
  coder-commands-mcp:
    image: clubuntu.dala-cirius.ts.net:5000/coder-commands-mcp:${IMAGE_TAG}
    container_name: coder-commands-mcp
    environment:
      DATABASE_URL: postgresql://${POSTGRES_USER}:${POSTGRES_PASSWORD}@postgres:5432/${POSTGRES_DB}
    depends_on:
      postgres:
        condition: service_healthy
    networks: [codercommands]
    restart: unless-stopped

  docker-mcp:
    image: clubuntu.dala-cirius.ts.net:5000/docker-mcp:${IMAGE_TAG}
    container_name: codercommands-docker-mcp
    volumes:
      - /var/run/docker.sock:/var/run/docker.sock
    networks: [codercommands]
    restart: unless-stopped
# postgres, sync, postgres-mcp, gateway follow the same shape
```

04 Verified

```
$ docker compose -f docker-compose.deploy.yml config --quiet
warning: "IMAGE_TAG" variable is not set. Defaulting to a
blank string. (x5)
exit 0
```

The warnings are expected here on the dev laptop — `IMAGE_TAG` is never set locally on purpose. On clubuntu, the deploy workflow sets it before this file is ever invoked, so the warning never appears there.

05 Next

- ▶ `.github/workflows/build.yml` and `deploy.yml`
- ▶ Commit and push everything to `kat-e8/manpage`
