

The Two Workflow Files

`.github/workflows/build.yml` and `deploy.yml` now exist, wired to the real path on `clubuntu` — `/opt/docker/manpage`, not the placeholder used throughout planning.

files: `.github/workflows/{build,deploy}.yml` (new) 2026-08-16

01 build.yml

```
name: build
on:
  push:
    branches: [main]

jobs:
  build-and-push:
    runs-on: [self-hosted, clubuntu]
    steps:
      - uses: actions/checkout@v4
      - run: |
          export IMAGE_TAG=${GITHUB_SHA::7}
          docker compose build
          docker compose push
```

Unchanged from the plan — every push to `main` builds and pushes all five images, tagged by short SHA.

02 deploy.yml — now with the real path

```
name: deploy
on:
  push:
    tags: ['v*']

jobs:
  deploy:
    runs-on: [self-hosted, clubuntu]
    steps:
      - uses: actions/checkout@v4
```

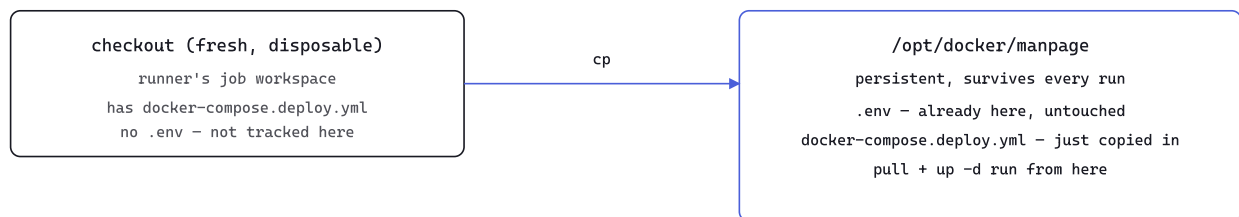

```

- run: |
  SHA=$(git rev-list -n 1 ${GITHUB_REF_NAME})
  echo "IMAGE_TAG=${SHA::7}" >> $GITHUB_ENV
- run: |
  cp docker-compose.deploy.yml /opt/docker/manpage/docker-compose.deploy.yml
- run: |
  cd /opt/docker/manpage
  docker compose -f docker-compose.deploy.yml pull
  docker compose -f docker-compose.deploy.yml up -d

```

The only substantive change from the planning doc: `~/codercommands` is now `/opt/docker/manpage` — the actual directory on clubuntu holding the persistent `.env`.

03 Where the fresh checkout ends and the persistent directory begins

The compose file travels to where the secrets already live — never the other way around. `.env` is never checked out, never in the job workspace, never in git at all.

04 Verified

```

$ python -c "import yaml; yaml.safe_load(open(f))" for both
files
.github/workflows/build.yml OK
.github/workflows/deploy.yml OK

```

Syntax-only — actual execution can't be verified until the self-hosted runner is registered on clubuntu (separate session, per the Machine Handoff doc).

05 Next

- ▶ Commit and push everything to `kat-e8/manpage`
- ▶ Then: clubuntu-side session registers the runner against this same repo
